CPD Overview

Stone Cladding Systems specialises in providing our own tried and tested Non-combustible Aztec Ventilated Rainscreen system tested to the latest CWCT standards.

Aztec is a light-weight Rainscreen application utilising all types of Natural Stone. This includes Sandstone; Limestone; Slate and Granite. Our materials are sourced from some of the top Dimensional Stone Quarries in UK as well as many from Europe giving the client a wealth of choice.

SCS brings together the accumulated experience of many individuals to offer our clients professional advice on various facade applications. Our expertise includes knowledge of numerous material finishes and how each material needs to be designed and used to integrate with the overall building design. We can offer full advice on "through the wall construction" bringing together partners that work with us to realise best value facade engineering for your project.

The Aztec rainscreen system is a flexible, ventilated facade available with a large range of natural stone types. This cost effective facade solution is available in 20mm, 30mm or 40mm panels with a stainless steel clip in a horizontal kerf attached to a T-rail using Tek screws. An anti-rattle neoprene strip is used to reduce wind effect and assist with impact resistance.

This is a fast-trac system installed without the need for scaffold thus saving time and money
