CPD Overview

VertEdge has been designed and thought out from over 35 years of knowledge in the flooring and artificial grass industry. It has been designed to provide a safer, stronger and smarter perimeter finish to an artificial lawn installation – there is nothing else in production worldwide that is similar to VertEdge in its design or application.

Current artificial lawn perimeter fixing methods are generally improvised using standard off the shelf building materials – i.e. wood, cement, plastic, nails, screws – with each contractor claiming their method is ‘the way to go’ and better than others. This creates confusion for the paying client/customer as there is no widely recognised industry standard for contractors to adhere to.

VertEdge addresses this issue with a purpose-designed product that provides consistency and uniform across the industry, which in turn would vastly improve the safety and quality of artificial grass installations for the end user. We believe that VertEdge is the solution to this recognised problem, and will become the industry standard.
